[MS-DOM2CX]: Microsoft XML Document Object Model (DOM) Level 2 Core Standards Support

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, IDL's, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications.
- No Trade Secrets. Microsoft does not claim any trade secret rights in this documentation.
- Patents. Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft Open Specification Promise or the Community Promise. If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplq@microsoft.com.
- **Trademarks.** The names of companies and products contained in this documentation may be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights.
- **Fictitious Names.** The example companies, organizations, products, domain names, e-mail addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

Revision Summary

Date	Revision History	Revision Class	Comments	
03/17/2010	0.1	New	Released new document.	
03/26/2010	1.0	None	Introduced no new technical or language changes.	
05/26/2010	1.2	None	Introduced no new technical or language changes.	
09/08/2010	1.3	Major	Significantly changed the technical content.	
02/10/2011	2.0	No change	Introduced no new technical or language changes.	
02/22/2012	3.0	Major	Significantly changed the technical content.	
07/25/2012	3.1	Minor	Clarified the meaning of the technical content.

1 Introduction

This document describes the level of support provided by the Microsoft XML Core Services (MSXML) 3.0 and 6.0 for the *Document Object Model (DOM) Level 2 Core Specification Version 1.0* [DOM Level 2 - Core], W3C Recommendation 13 November, 2000.

The [DOM Level 2 - Core] specification may contain guidance for authors of webpages and browser users, in addition to user agents (browser applications). Statements found in this document apply only to normative requirements in the specification targeted to user agents, not those targeted to authors.

1.1 Glossary

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as described in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

References to Microsoft Open Specifications documentation do not include a publishing year because links are to the latest version of the technical documents, which are updated frequently. References to other documents include a publishing year when one is available.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information. Please check the archive site, http://msdn2.microsoft.com/en-us/library/E4BD6494-06AD-4aed-9823-445E921C9624, as an additional source.

[DOM Level 2 - Core] W3C, "Document Object Model (DOM) Level 2 Core Specification Version 1.0", W3C Recommendation 13 November, 2000, http://www.w3.org/TR/DOM-Level-2-Core/

[NamespacesXML1.1] Bray, T., Hollander, D., Layman, A., and Tobin, R., Eds., "Namespaces in XML 1.1 (Second Edition)", W3C Recommendation 16 August 2006, http://www.w3.org/TR/xml-names11/

[RFC2119] Bradner, S., "Key words for use in RFCs to Indicate Requirement Levels", BCP 14, RFC 2119, March 1997, http://www.rfc-editor.org/rfc/rfc2119.txt

1.2.2 Informative References

None.

1.3 Microsoft Implementations

Throughout this document, Microsoft XML Core Services (MSXML) 3.0 is referred to as *MSXML3* and Microsoft XML Core Services (MSXML) 6.0 is referred to as *MSXML6*.

MSXML3 is the only version of MSXML that is implemented in Windows® Internet Explorer® 7 and Windows® Internet Explorer® 8. Both MSXML3 and MSXML6 are implemented in Windows® Internet Explorer® 9 and Windows® Internet Explorer® 10.

4 / 28

1.4 Standards Support Requirements

To conform to [DOM Level 2 - Core], a user agent must implement all required portions of the specification. Any optional portions that have been implemented must also be implemented as described by the specification. Normative language is usually used to define both required and optional portions. (For more information, see [RFC2119].)

The following table lists the sections of [DOM Level 2 - Core] and whether they are considered normative or informative.

Section	Normative/Informative	
1	Normative	
Appendices A-F	Informative	

1.5 Notation

The following notations are used in this document to differentiate between notes of clarification, variation from the specification, and extension points.

Notation	Explanation	
C####	Identifies a clarification of ambiguity in the target specification. This includes imprecise statements, omitted information, discrepancies, and errata. This does not include data formatting clarifications.	
V####	Identifies an intended point of variability in the target specification such as the use of MAY, SHOULD, or RECOMMENDED. (See [RFC2119].) This does not include extensibility points.	
E####	es extensibility points (such as optional implementation-specific data) in the target cation, which can impair interoperability.	

For document mode and browser version notation, see section 1.3.

2 Standards Support Statements

This section contains a full list of clarifications in the Microsoft implementation of [DOM Level 2 - Core].

- Section <u>2.1</u> includes only those variations that violate a MUST requirement in the target specification.
- Section 2.2 describes further variations from MAY and SHOULD requirements.
- Section 2.3 identifies variations in error handling.
- Section 2.4 identifies variations that impact security.

2.1 Normative Variations

There are no Normative Variations to the [DOM Level 2 - Core].

2.2 Clarifications

The following subsections identify clarifications to recommendations made by [DOM Level 2 - Core].

2.2.1 [DOM Level 2 - Core] Section 1.1.5, The DOMString type

C0001:

The specification states:

```
Type Definition DOMString
A DOMString is a sequence of 16-bit units.

IDL Definition
valuetype DOMString sequence<unsigned short>;
```

MSXML3 and MSXML6

The **DOMString** type is not defined. A BSTR value is used instead.

2.2.2 [DOM Level 2 - Core] Section 1.1.6, The DOMTimeStamp type

C0002:

The specification states:

```
•Type Definition DOMTimeStamp
A DOMTimeStamp represents a number of milliseconds.

IDL Definition
typedef unsigned long long DOMTimeStamp;

•Note: Even though the DOM uses the type DOMTimeStamp, bindings may use different types. For example for Java, DOMTimeStamp is bound to the long type. In ECMAScript, TimeStamp is bound to the Date type because the range of the integer type is too small.
```

MSXML3 and MSXML6

6 / 28

[MS-DOM2CX] — v20120725 Microsoft XML Document Object Model (DOM) Level 2 Core Standards Support

Copyright © 2012 Microsoft Corporation.

The **DOMTimeStamp** definition type is not defined, and there are no APIs that use parameters related to the **DOMTimeStamp**.

2.2.3 [DOM Level 2 - Core] Section 1.2, Fundamental Interfaces

C0003:

The specification states:

```
IDL Definition
 exception DOMException {
   unsigned short code;
// ExceptionCode

const unsigned short INDEX_SIZE_ERR = 1;

const unsigned short DOMSTRING_SIZE_ERR = 2;

const unsigned short HIERARCHY_REQUEST_ERR = 3;

const unsigned short WRONG_DOCUMENT_ERR = 4;

const unsigned short INVALID_CHARACTER_ERR = 5;

const unsigned short NO_DATA_ALLOWED_ERR = 6;

const unsigned short NO_MODIFICATION_ALLOWED_ERR = 7;

const unsigned short NOT_FOUND_ERR = 8;

const unsigned short NOT_SUPPORTED_ERR = 9;

const unsigned short INUSE_ATTRIBUTE_ERR = 10;

// Introduced in DOM_Level 2:
 // ExceptionCode
 // Introduced in DOM Level 2:
 const unsigned short INVALID STATE ERR
                                                                                                = 11;
// Introduced in DOM Level 2:
const unsigned short SYNTAX ERR
                                                                                                   = 12:
// Introduced in DOM Level 2:
const unsigned short INVALID MODIFICATION ERR
 // Introduced in DOM Level 2:
 const unsigned short NAMESPACE ERR
                                                                                                   = 14;
 // Introduced in DOM Level 2:
 const unsigned short INVALID ACCESS ERR
                                                                                                  = 15:
```

MSXML3 and MSXML6

DOMException is not implemented; instead, HRESULT values are returned. The HRESULT code is very different in terms of error types and meanings. Windows terminology uses all uppercase for HRESULT.

V0001:

The specification states:

7 / 28

[MS-DOM2CX] — v20120725 Microsoft XML Document Object Model (DOM) Level 2 Core Standards Support

Copyright © 2012 Microsoft Corporation.

};

MSXML3 and MSXML6

The **createDocumentType** and **createDocument** methods of the **DOMImplementation** interface are not supported.

C0004:

The specification states:

```
Met.hod
hasFeature
Test if the DOM implementation implements a specific feature.
feature of type DOMString
The name of the feature to test (case-insensitive). The values used by DOM features are
defined throughout the DOM Level 2 specifications and listed in the Conformance section. The
name must be an XML name. To avoid possible conflicts, as a convention, names referring to
features defined outside the DOM specification should be made unique by reversing the name of
the Internet domain name of the person (or the organization that the person belongs to) who
defines the feature, component by component, and using this as a prefix. For instance, the
W3C SVG Working Group defines the feature "org.w3c.dom.svg".
version of type DOMString
This is the version number of the feature to test. In Level 2, the string can be either "2.0"
or "1.0". If the version is not specified, supporting any version of the feature causes the
method to return true.
Return Value
boolean true if the feature is implemented in the specified version, false otherwise.
No Exceptions
```

MSXML3

The **hasFeature** method of the **DOMImplementation** interface supports only the following parameter values:

- feature= "XML"
- version="1.0"

The **version** parameter cannot be empty. For more information about the "XML" value, see [DOM Level 2 - Core], Conformance.

MSXML6

The **hasFeature** method of the **DOMImplementation** interface supports only the **feature**= "XML" parameter value.

C0005:

The specification defines the **Document** interface.

8 / 28

[MS-DOM2CX] — v20120725 Microsoft XML Document Object Model (DOM) Level 2 Core Standards Support

Copyright © 2012 Microsoft Corporation.

The following additional **Document** interface attributes are supported:

- async
- parseError
- preserveWhiteSpace
- readyState
- resolveExternals
- url
- validateOnParse

The following additional **Document** interface methods are supported:

- abort
- createNode
- load
- loadXML
- nodeFromID
- save

The following **Document** interface events are supported:

- ondataavailable
- onreadystatechange
- ontransformnode

The following methods are not supported:

- importNode
- createElementNS
- createAttributeNS
- getElementsByTagNameNS
- getElementById

The **documentElement** attribute is read/write, not read-only.

C0006:

The specification states:

Interface Document

```
Attribute
```

```
documentElement of type Element, readonly

This is a convenience attribute that allows direct access to the child node that is the root element of the document. For HTML documents, this is the element with the tagName "HTML".
```

The **documentElement** attribute of the **Document** interface is read/write, not read-only.

C0007:

The specification defines the interface **node**.

MSXML3 and MSXML6

The following clarifications apply:

- The methods **isSupported**, **hasAttributes**, and **normalize** are not supported.
- The normalize method is defined in Element.
- The localName method is not supported, but baseName is supported for similar functionality.
- Additional attributes are supported:
 - dataType
 - definition
 - •nodeTypeString
 - •nodeTypedValue
 - parsed
 - specified
 - •text
 - •xml
- Additional methods are supported:
 - selectNodes
 - •selectSingleNode
 - transformNode
 - transformNodeToObject
- The *nodeType* is defined as:

```
enum tagDOMNodeType
{
```

```
NODE_INVALID, // = 0
NODE_ELEMENT, // = 1
NODE_ATTRIBUTE, // = 2
NODE_TEXT, // = 3
NODE_CDATA_SECTION, // = 4
NODE_ENTITY_REFERENCE, // = 5
NODE_ENTITY, // = 6
NODE_PROCESSING_INSTRUCTION, // = 7
NODE_COMMENT, // = 8
NODE_DOCUMENT, // = 9
NODE_DOCUMENT_TYPE, // = 10
NODE_DOCUMENT_FRAGMENT, // = 11
NODE_NOTATION // = 12
} DOMNodeType;
```

The names of node types are defined as **NODE_xxx** instead of **xxx_NODE**.

C0008:

The specification states:

```
attributes of type NamedNodeMap, readonly A NamedNodeMap containing the attributes of this node (if it is an Element) or null otherwise.
```

MSXML3 and MSXML6

The **attributes** attribute of the **NamedNodeMap** interface may return the **IXMLDOMNamedNodeMap** object for the following constants:

- NODE ELEMENT
- NODE PROCESSING INSTRUCTION
- NODE DOCUMENT TYPE
- NODE ENTITY
- NODE_NOTATION

C0009:

The specification states:

```
Attribute

localName of type DOMString, readonly, introduced in DOM Level 2

Returns the local part of the qualified name of this node.

For nodes of any type other than ELEMENT_NODE and ATTRIBUTE_NODE and nodes created with a DOM Level 1 method, such as createElement from the Document interface, this is always null.
```

MSXML3 and MSXML6

11 / 28

[MS-DOM2CX] — v20120725 Microsoft XML Document Object Model (DOM) Level 2 Core Standards Support

Copyright © 2012 Microsoft Corporation.

The **baseName** attribute of the **Node** interface is supported and provides the same functionality as **localName**. However, **baseName** returns an empty string for nodes other than **element** and **attribute**.

C0010:

The specification states:

```
Attribute

namespaceURI of type DOMString, readonly, introduced in DOM Level 2

The namespace URI of this node, or null if it is unspecified.

This is not a computed value that is the result of a namespace lookup based on an examination of the namespace declarations in scope. It is merely the namespace URI given at creation time.

For nodes of any type other than ELEMENT_NODE and ATTRIBUTE_NODE and nodes created with a DOM Level 1 method, such as createElement from the Document interface, this is always
```

Note: Per the Namespaces in XML Specification [NamespacesXML1.1] an attribute does not inherit its namespace from the element it is attached to. If an attribute is not explicitly given a namespace, it simply has no namespace.

MSXML3 and MSXML6

The following clarifications apply:

- The namespaceURI attribute of the Node interface returns an empty string if the namespace URI of the node is not specified.
- The namespaceURI attribute returns an empty string for nodes other than element and attribute.

V0002:

The specification states:

```
Attribute

nodeValue of type DOMString

The value of this node, depending on its type; see the table above. When it is defined to be null, setting it has no effect.

Exceptions on setting

DOMException NO_MODIFICATION_ALLOWED_ERR: Raised when the node is readonly.

Exceptions on retrieval

DOMException DOMSTRING_SIZE_ERR: Raised when it would return more characters than fit in a DOMString variable on the implementation platform.
```

MSXML3 and MSXML6

The **DOMSTRING_SIZE_ERR** exception for the **nodeValue** attribute of the **Node** interface is not returned because the only limit of a BSTR value is physical memory.

C0011:

The specification states:

12 / 28

```
[MS-DOM2CX] — v20120725
Microsoft XML Document Object Model (DOM) Level 2 Core Standards Support
```

Copyright © 2012 Microsoft Corporation.

Attribute

prefix of type DOMString, introduced in DOM Level 2

The namespace prefix of this node, or null if it is unspecified.

Note that setting this attribute, when permitted, changes the nodeName attribute, which holds the qualified name, as well as the tagName and name attributes of the Element and Attributerfaces, when applicable.

Note also that changing the prefix of an attribute that is known to have a default value, does not make a new attribute with the default value and the original prefix appear, since the namespaceURI and localName do not change.

For nodes of any type other than ELEMENT_NODE and ATTRIBUTE_NODE and nodes created with a DOM Level 1 method, such as createElement from the Document interface, this is always null.

Exceptions on setting

 ${\tt DOMException\ INVALID_CHARACTER_ERR:\ Raised\ if\ the\ specified\ prefix\ contains\ an\ illegal\ character.}$

NO MODIFICATION ALLOWED ERR: Raised if this node is readonly.

NAMESPACE_ERR: Raised if the specified prefix is malformed, if the namespaceURI of this node is null, if the specified prefix is "xml" and the namespaceURI of this node is different from "http://www.w3.org/XML/1998/namespace", if this node is an attribute and the specified prefix is "xmlns" and the namespaceURI of this node is different from "http://www.w3.org/2000/xmlns/", or if this node is an attribute and the qualifiedName of this node is "xmlns" [NamespacesXML1.1].

MSXML3 and MSXML6

The following clarifications apply:

- The prefix attribute of the Node interface is read-only. Any attempt to set a new value for prefix causes an exception.
- An empty string is returned if the namespace prefix of the node is not specified, or if the node is not an element or an attribute.

C0012:

The specification states:

appendChild

Adds the node newChild to the end of the list of children of this node. If the newChild is already in the tree, it is first removed.

Parameters

newChild of type Node

The node to add.

If it is a DocumentFragment object, the entire contents of the document fragment are moved into the child list of this node

Return Value

Node

The node added.

Exceptions

DOMException

HIERARCHY_REQUEST_ERR: Raised if this node is of a type that does not allow children of the type of the newChild node, or if the node to append is one of this node's ancestors.

 $WRONG_DOCUMENT_ERR$: Raised if newChild was created from a different document than the one that created this node.

13 / 28

[MS-DOM2CX] — v20120725 Microsoft XML Document Object Model (DOM) Level 2 Core Standards Support

Copyright © 2012 Microsoft Corporation.

The **appendChild** method of the **Node** interface can accept a **newChild** node that was created from a different document. A **WRONG_DOCUMENT_ERR** exception is not thrown in this case.

C0013:

The specification states:

```
replaceChild
Replaces the child node oldChild with newChild in the list of children, and returns the
oldChild node.
If newChild is a DocumentFragment object, oldChild is replaced by all of the DocumentFragment
children, which are inserted in the same order. If the newChild is already in the tree, it is
first removed.
Parameters
newChild of type Node
The new node to put in the child list.
oldChild of type Node
The node being replaced in the list.
Return Value
Node
The node replaced.
Exceptions
HIERARCHY REQUEST ERR: Raised if this node is of a type that does not allow children of the
type of the newChild node, or if the node to put in is one of this node's ancestors.
WRONG DOCUMENT ERR: Raised if newChild was created from a different document than the one
that created this node.
NO MODIFICATION ALLOWED ERR: Raised if this node or the parent of the new node is readonly.
NOT_FOUND_ERR: Raised if oldChild is not a child of this node.
```

MSXML3 and MSXML6

The **replaceChild** method of the **Node** interface accepts a **newChild** node that was created from a different document. A **WRONG_DOCUMENT_ERR** exception is not thrown in this case.

E0001:

The specification states:

IDL Definition

```
interface NodeList {
Node item(in unsigned long index);
```

14 / 28

[MS-DOM2CX] — v20120725 Microsoft XML Document Object Model (DOM) Level 2 Core Standards Support

Copyright © 2012 Microsoft Corporation.

```
readonly attribute unsigned long length;
};
```

The **NodeList** interface has two additional methods, **nextNode** and **reset**. The **length** attribute and **index** of the **item** method is of type long instead of unsigned long.

E0002:

The specification defines the **NamedNodeMap** interface.

MSXML3 and MSXML6

The following NamedNodeMap interface methods are not supported:

- getNamedItemNS
- removeNamedItemNS
- setNamedItemNS

The following additional **NamedNodeMap** interface methods are supported:

- getQualifiedItem
- nextNode
- removeQualifiedItem
- reset

The **length** attribute is of type long instead of unsigned long.

C0014:

The specification states:

```
removeNamedItem
Removes a node specified by name. When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.
Parameters
name of type DOMString
The nodeName of the node to remove.

Return Value
Node
The node removed from this map if a node with such a name exists.

Exceptions
DOMException
NOT_FOUND_ERR: Raised if there is no node named name in this map.

NO_MODIFICATION_ALLOWED_ERR: Raised if this map is readonly.
```

15 / 28

[MS-DOM2CX] — v20120725 Microsoft XML Document Object Model (DOM) Level 2 Core Standards Support

Copyright © 2012 Microsoft Corporation.

The **removeNamedItem** method of the **NamedNodeMap** interface returns null if no node is specified for the **name** parameter. The **NOT_FOUND_ERR** exception is never thrown.

C0015:

The specification states:

setNamedItem

Adds a node using its nodeName attribute. If a node with that name is already present in this map, it is replaced by the new one.

As the nodeName attribute is used to derive the name which the node must be stored under, multiple nodes of certain types (those that have a "special" string value) cannot be stored as the names would clash. This is seen as preferable to allowing nodes to be aliased.

arg of type Node

A node to store in this map. The node will later be accessible using the value of its nodeName attribute.

Return Value

Node

If the new Node replaces an existing node the replaced Node is returned, otherwise null is returned.

Exceptions

DOMException

WRONG_DOCUMENT_ERR: Raised if arg was created from a different document than the one that created this map.

NO MODIFICATION ALLOWED_ERR: Raised if this map is readonly.

INUSE_ATTRIBUTE_ERR: Raised if arg is an Attr that is already an attribute of another Element object. The DOM user must explicitly clone Attr nodes to re-use them in other elements.

MSXML3 and MSXML6

The **setNamedItem** method of the **NamedNodeMap** interface has the following behaviors:

- The method returns the node that was successfully added to the collection, not the previously existing node.
- The method accepts a node that was created by a different document, so it never throws the WRONG_DOCUMENT_ERR exception.

C0016:

The specification defines the **CharacterData** interface.

MSXML3 and MSXML6

The length, offset, and count attributes of the CharacterData interface are of type long, instead of unsigned long.

C0017:

The specification states:

16 / 28

[MS-DOM2CX] — v20120725 Microsoft XML Document Object Model (DOM) Level 2 Core Standards Support

Copyright © 2012 Microsoft Corporation.

data of type DOMString

The character data of the node that implements this interface. The DOM implementation may not put arbitrary limits on the amount of data that may be stored in a CharacterData node. However, implementation limits may mean that the entirety of a node's data may not fit into a single DOMString. In such cases, the user may call substringData to retrieve the data in appropriately sized pieces.

Exceptions on setting

DOMException

NO MODIFICATION ALLOWED ERR: Raised when the node is readonly.

Exceptions on retrieval

DOMException

DOMSTRING_SIZE_ERR: Raised when it would return more characters than fit in a DOMString variable on the implementation platform.

length of type unsigned long, readonly

The number of 16-bit units that are available through data and the substringData method below. This may have the value zero, i.e., CharacterData nodes may be empty.

MSXML3 and MSXML6

The **data** attribute of the **CharacterData** interface does not return an error code in the same manner as the **DOMSTRING_SIZE_ERR** because the only limit of a BSTR value is physical memory.

C0018:

The specification states:

substringData

Extracts a range of data from the node.

Parameters

offset of type unsigned long

Start offset of substring to extract.

count of type unsigned long

The number of 16-bit units to extract.

Return Value

DOMString

The specified substring. If the sum of offset and count exceeds the length, then all 16-bit units to the end of the data are returned.

Exceptions

DOMException

INDEX_SIZE_ERR: Raised if the specified offset is negative or greater than the number of 16-bit units in data, or if the specified count is negative.

DOMSTRING SIZE ERR: Raised if the specified range of text does not fit into a DOMString.

MSXML3 and MSXML6

17 / 28

[MS-DOM2CX] — v20120725 Microsoft XML Document Object Model (DOM) Level 2 Core Standards Support

Copyright © 2012 Microsoft Corporation.

The **substringData** method of the **CharacterData** interface does not return an error code in the same manner as the **DOMSTRING_SIZE_ERR** because the only limit of a BSTR value is physical memory.

C0019:

The specification states:

MSXML3 and MSXML6

The following clarifications apply:

- The **ownerElement** attribute of the **Attr** interface is not supported.
- The type of the **value** attribute is VARIANT.
- The type of the **specified** attribute is VARIANT BOOL.

C0020:

The specification defines the **Element** interface.

MSXML3 and MSXML6

The following methods of the **Element** interface are supported:

- getAttribute
- getAttributeNode
- getElementsByTagName
- removeAttribute
- removeAttributeNode
- setAttribute
- setAttributeNode

The following methods are not supported:

- getAttributeNodeNS
- getAttributeNS
- getElementsByTagNameNS

18 / 28

- hasAttribute
- hasAttributeNS
- removeAttributeNS
- setAttributeNodeNS
- setAttributeNS

The following clarifications apply:

- The **getAttribute** method returns a value of type VARIANT.
- The **setAttribute** method requires that the **value** attribute is of type VARIANT.

C0021:

The specification states:

```
getAttribute
Retrieves an attribute value by name.
Parameters
name of type DOMString
The name of the attribute to retrieve.

Return Value
DOMString
The Attr value as a string, or the empty string if that attribute does not have a specified or default value.

No Exceptions
```

MSXML3 and MSXML6

The **getAttribute** method of the **Element** interface returns null if the attribute does not have a specified or default value.

C0022:

The specification states:

```
setAttributeNode
Adds a new attribute node. If an attribute with that name (nodeName) is already present in the element, it is replaced by the new one.
To add a new attribute node with a qualified name and namespace URI, use the setAttributeNodeNS method.
Parameters
newAttr of type Attr
The Attr node to add to the attribute list.

Return Value
Attr
If the newAttr attribute replaces an existing attribute, the replaced Attr node is returned, otherwise null is returned.

Exceptions
```

19 / 28

DOMException

 ${\tt WRONG_DOCUMENT_ERR:} \ {\tt Raised} \ {\tt if} \ {\tt newAttr} \ {\tt was} \ {\tt created} \ {\tt from} \ {\tt a} \ {\tt different} \ {\tt document} \ {\tt than} \ {\tt the} \ {\tt one} \ {\tt that} \ {\tt created} \ {\tt the} \ {\tt element.}$

NO MODIFICATION ALLOWED ERR: Raised if this node is readonly.

INUSE_ATTRIBUTE_ERR: Raised if newAttr is already an attribute of another Element object. The DOM user must explicitly clone Attr nodes to re-use them in other elements.

MSXML3 and MSXML6

The **setAttributeNode** method of the **Element** interface can accept new attribute node *newAttr* that was created from a different document. A **WRONG_DOCUMENT_ERR** error is not thrown in such case.

C0023:

The specification states:

MSXML3 and MSXML6

The offset parameter of the splitText method of the Text interface is of type long.

V0003:

The specification states:

```
Method
splitText
       Breaks this node into two nodes at the specified offset, keeping both in the tree as
siblings. After being split, this node will contain all the content up to the offset point. A
new node of the same type, which contains all the content at and after the offset point, is
returned. If the original node had a parent node, the new node is inserted as the next
sibling of the original node. When the offset is equal to the length of this node, the new
node has no data.
Parameters
offset of type unsigned long
       The 16-bit unit offset at which to split, starting from 0.
Return Value
           The new node, of the same type as this node.
Exceptions
DOMException
                INDEX SIZE ERR: Raised if the specified offset is negative or greater than
the number of 16-bit units in data.
                NO MODIFICATION ALLOWED ERR: Raised if this node is readonly.
```

Copyright © 2012 Microsoft Corporation.

The **splitText** method of the **Text** interface returns null when the value of **offset** parameter is the length of the data.

2.2.4 [DOM Level 2 - Core] Section 1.3, Extended Interfaces

C0024:

The specification states:

```
IDL Definition
interface DocumentType : Node {
 readonly attribute DOMString
                                 name;
 readonly attribute NamedNodeMap
                                   entities;
 readonly attribute NamedNodeMap
                                  notations;
 // Introduced in DOM Level 2:
 readonly attribute DOMString
                                 publicId;
 // Introduced in DOM Level 2:
 readonly attribute DOMString
                                 systemId;
 // Introduced in DOM Level 2:
 readonly attribute DOMString internalSubset;
};
```

MSXML3 and MSXML6

The following attributes of the **DocumentType** interface are supported:

- name
- entities
- notations

The following attributes of the **DocumentType** interface are not supported:

- internalSubset
- publicId
- systemId

C0025:

The specification states:

```
A Notation node does not have any parent.
```

MSXML3 and MSXML6

The parent of a **Notation** node is the **DocumentType** node.

V0004:

The specification states:

21 / 28

[MS-DOM2CX] — v20120725 Microsoft XML Document Object Model (DOM) Level 2 Core Standards Support

Copyright © 2012 Microsoft Corporation.

The attributes **publicId** and **systemId** of the **Notation** interface are of type VARIANT.

C0026:

The specification states:

```
Attributes
publicId of type DOMString, readonly
The public identifier of this notation. If the public identifier was not specified, this is null.
systemId of type DOMString, readonly
The system identifier of this notation. If the system identifier was not specified, this is null.
```

MSXML3 and MSXML6

The **publicId** and **systemId** attributes of the **Notation** interface return an empty string if the public or system identifier, respectively, was not specified.

C0027:

The specification states:

```
Interface Entity
An XML processor may choose to completely expand entities before the structure model is passed to the DOM; in this case there will be no EntityReference nodes in the document tree.
```

MSXML3 and MSXML6

The references for the **Entity** interface are completely expanded when the XML content is parsed.

C0028:

The specification states:

```
An Entity node does not have any parent.
```

MSXML3 and MSXML6

The parent of an **entity** node is the **documentType** node to which it belongs.

V0005:

The specification states:

```
IDL Definition
```

22 / 28

[MS-DOM2CX] — v20120725 Microsoft XML Document Object Model (DOM) Level 2 Core Standards Support

Copyright © 2012 Microsoft Corporation.

```
interface Entity : Node {
  readonly attribute DOMString
  readonly attribute DOMString
  readonly attribute DOMString
  readonly attribute DOMString
}:
```

The type of **publicId** and **systemId** attributes in the **Entity** interface is VARIANT.

C0029:

The specification states:

```
notationName of type DOMString, readonly For unparsed entities, the name of the notation for the entity. For parsed entities, this is null.
```

MSXML3 and MSXML6

For parsed entities of the **Entity** interface, the **notationName** attribute returns an empty string.

C0030:

The specification states:

```
publicId of type DOMString, readonly
The public identifier associated with the entity, if specified. If the public identifier was
not specified, this is null.
```

MSXML3 and MSXML6

The **publicId** attribute of the **Notation** interface returns an empty string if the public identifier was not specified.

C0031:

The specification states:

```
systemId of type DOMString, readonly
The system identifier associated with the entity, if specified. If the system identifier was not specified, this is null.
```

MSXML3 and MSXML6

The **systemId** attribute of the **Entity** interface returns an empty string if the system identifier was not specified.

C0032:

The specification states:

```
data of type DOMString
```

23 / 28

[MS-DOM2CX] — v20120725 Microsoft XML Document Object Model (DOM) Level 2 Core Standards Support

Copyright © 2012 Microsoft Corporation.

The content of this processing instruction. This is from the first non white space character after the target to the character immediately preceding the ?>.

Exceptions on setting DOMException NO_MODIFICATION_ALLOWED_ERR: Raised when the node is readonly.

MSXML3 and MSXML6

The **data** attribute contains the content from the first non-white-space character that follows the target declaration to the last non-white-space character that precedes the closing ?> characters.

2.3 Error Handling

There are no additional considerations for error handling.

2.4 Security

There are no additional security considerations.

3 Change Tracking

This section identifies changes that were made to the [MS-DOM2CX] protocol document between the February 2012 and July 2012 releases. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- An extensive rewrite, addition, or deletion of major portions of content.
- The removal of a document from the documentation set.
- Changes made for template compliance.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the language and formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical or language changes were introduced. The technical content of the document is identical to the last released version, but minor editorial and formatting changes, as well as updates to the header and footer information, and to the revision summary, may have been made.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.

- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.
- New content added for template compliance.
- Content updated for template compliance.
- Content removed for template compliance.
- Obsolete document removed.

Editorial changes are always classified with the change type Editorially updated.

Some important terms used in the change type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact protocol@microsoft.com.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
1 Introduction	Updated document to remove beta tagging.	N	Content updated.
